2026 SHENZHEN INTERNATIONAL FINTECH COMPETITION · INTERNATIONAL TRACK · TOPIC C

Security Self-Assessment Report

StudyRoute: permission tiers, control assurance and residual risk

Project	StudyRoute: cross-border tuition payment assistant (sandbox)
Competition	2026 Shenzhen International FinTech Competition (FinTechathon 2026), International Track
Topic	Topic C: Cross-border and Student Finance Assistant
Team	TeamEkxin
Document ID	SR-SEC-2026-01
Assessment type	Security self-assessment (not an independent certification)
Recorded evidence	15–18 October 2026
Prepared for	Competition review panel
Repository	github.com/NoobCrow/StudyRoute
Classification	Public: synthetic data only

> Synthetic-data demonstrator. Self-assessment, not production certification. No real money, live banking integration or independent certification.

Document control

Title	StudyRoute Security Self-Assessment Report
Document ID	SR-SEC-2026-01
Prepared by	TeamEkxin
Prepared for	2026 Shenzhen International FinTech Competition review panel
Status	Final submission
Evidence period	15–18 October 2026
Scope	StudyRoute main branch and its recorded lab evidence; synthetic data only
Structure	Sections 1–5 summarise; sections 6–10 give method, findings, risk and sources; Appendix A lists every recorded check

Contents

1. Executive Summary
- 1.1 Executive assessment

2. Background
- 2.1 System & trust boundaries

3. Assessment Scope
- 3.1 Scope, provenance & method

4. Summary of Findings
- 4.1 Verification results & evidence limits
- 4.2 Findings and remediation recorded by the team

5. Summary of Recommendations
- 5.1 Release gates & incident readiness

6. Introduction
- 6.1 Final-submission update

7. Assessment Methodology
- 7.1 Attack testing, leakage and MITM: scope & results
- 7.2 Attack families and expected safeguards

8. Detailed Findings
- 8.1 Permission tiers & separation of duties
- 8.2 Identity & transaction safeguards
- 8.3 Data, AI & artifact protection
- 8.4 Audit integrity: the exact guarantee
- 8.5 Data-leakage scope and MITM exposure

9. Risk Methodology
- 9.1 Prioritized risk register
- 9.2 Residual risk & remediation

10. Documentation Lists
- 10.1 References & evidence locator
- 10.2 Evidence references and assessment limits

Appendix A. Complete Recorded Check Catalogue

1. Executive Summary

1.1 Executive assessment

Decision & assurance

Final-submission security-evidence update. Section 7 and Appendix A itemize the recorded attack, brute-force, data-leakage, MITM, adversarial-assistant and browser-security probes. These are supplied team-run lab results, not a new independent pentest or public-deployment assessment.

StudyRoute is a synthetic-data demonstrator for cross-border student payments. Its security design separates deterministic financial calculations, AI-assisted preparation and human authorization. The reviewed source enforces significant safeguards, but the evidence supports a controlled sandbox demonstration—not production payment processing or a regulatory compliance claim. [C01–C10]

Assessment area	Conclusion
Authorization	Role + token scope + ownership checks; human-only payment approval with action-bound step-up.
Transactional integrity	Idempotency, state-machine guards, summary hashes and audit records tested locally.
Data protection	Field-level authenticated encryption and session controls are implemented; operator key custody remains a trust boundary.
AI safety	AI is constrained by domain permissions and tool restrictions. Model accuracy is not treated as authorization.
Deployment readiness	Conditional for isolated synthetic demonstration. Public HTTPS, operational hardening and live rails are not verified.

Evidence established for this report

Fresh backend regression: **1,672 passed / 0 failed / 0 errors / 1 skipped**. Fresh HTTP API demonstration: **66 checks passed, 0 failed**. The local audit verified **76 events**; editing event 75 was detected and restoration returned PASS. All four local model components loaded. These are local results on the supplied main-branch archive, not Botkeep deployment results. [E01–E06]

> **No independent certification** — This is a source-based self-assessment and reproducibility review. It is not an independent penetration test, banking authorization, ISO certification or guarantee that no vulnerabilities exist. No project owner has signed a risk acceptance as part of this report.

2. Background

2.1 System & trust boundaries

Threat model

Trust-boundary diagram

Protected asset	Principal threats / boundary
Identity and sessions	Credential guessing, stolen bearer tokens, session replay and cross-site requests. Browser → API.

Protected asset	Principal threats / boundary
Payment instructions	Unauthorized approval, stale quote, changed recipient/amount, duplicate execution. API → domain.
Sensitive fields and provider keys	Database copying, logs, cross-user disclosure, optional third-party AI disclosure. Domain → storage/provider.
Audit and ledger records	Incomplete edits, reordered events, coordinated database-owner rewrite. API → SQLite → independent reviewer.
Models and rule configuration	Artifact replacement, parser flaws, model error, stale or unverified financial assumptions. Repository → runtime.

Attacker assumptions

Consider unauthenticated clients, authenticated users from another household, compromised parent/student sessions, malicious prompt/document content, forged provider events, and an operator or database owner with privileged filesystem access. These attackers do not have equal capabilities; in particular, a database-owner limitation is not evidence of an unauthenticated remote exploit. [C01–C09]

> **Important exception** — The reviewer/admin is intentionally cross-household for review and administration. Parent, student and delegated AI access are household-scoped. A reviewer cannot replace the parent's payment approval. [C01; C03]

3. Assessment Scope

3.1 Scope, provenance & method

Assessment boundary

Item	Reviewed scope
Source package	StudyRoute-main.zip; 834 archived files; 116,683,391 uncompressed bytes.
Repository context	NoobCrow/StudyRoute, main archive supplied by the project owner.
Archive commit identifier	bcce930ae0974712e922245878fd976b03a8938a
Review date	18 October 2026 (UTC).
Execution environment	Linux x86_64; Python 3.13.14; reused local dependency environment.
Test boundary	Disposable SQLite test databases and one isolated loopback HTTP API instance.

Procedure

- Inspect security-critical code and existing design/risk documents; reconcile contradictory summaries against raw evidence.
- Run the complete supplied backend suite, the repository scanner and the four local model loaders; preserve logs and JUnit output.
- Execute the supplied 14-step sandbox flow against a fresh local API with all local model modes set to auto, then perform the supported tamper/restore demonstration.
- Recompute both supplied and fresh audit chains outside the running API; publish source identity and evidence hashes.

Explicit exclusions

No external penetration testing, internet-facing TLS assessment, load testing, new vulnerability-advisory database scan, clean-machine dependency installation, model retraining, new blind study, real provider call, real KYC/sanctions integration or actual financial settlement was performed. Docker, frontend builds and browser probes were not rerun for this report. [E01–E06; H01–H04]

> **Branch and deployment boundary** — The Botkeep branch uses a separate packaging/bootstrap path and was still being imported during this work. This report assesses the supplied main archive; it does not certify that deployment, its Release downloader, environment variables or public domain.

4. Summary of Findings

Findings at a glance. Counts are taken from the risk register (section 9) and the recorded check catalogue (Appendix A); nothing here is a new test.

Measure	High	Medium	Total
Prioritized risks in the register (SR-01 to SR-10)	5	5	10

Recorded security checks (Appendix A)	PASS	INFO	Total
Six team-run probe families, 18 October 2026	308	6	314

4.1 Verification results & evidence limits

What was actually checked

Evidence class	Observed result	Interpretation
Fresh backend suite	1,672 passed / 0 failed / 0 errors / 1 skipped	Supplied tests on exact extracted source; raw JUnit/logs included.
Fresh local HTTP flow	66 OK; 0 FAIL; exit 0	14 steps, simulated provider/financial services, real local API.
Fresh tamper experiment	PASS → FAIL at 75 → PASS	76-event baseline; mutation/restoration in disposable database only.
Independent recomputation	Supplied 75 / fresh 76 events valid	Canonical hashing; excludes derived amount_display display field.
Fresh model load	Reader + policy + risk + local explainer	Components loaded; not a fresh quality/safety benchmark.
Source scanner	Exit 0; no configured-pattern findings	Pattern-based source scan; not Git-history, binary or secret-revocation proof.
Inherited probes	146/146; 8/8; 42/42; 14 defended; 48/48	Team-authored historical tools; not rerun or independent pentest.
Inherited data-leak scan	50 PASS; 2 informational metadata findings	Canary checks in disposable database, logs, audit and responses; raw S03. Not rerun; see section 7 and Appendix A.

Do not add overlapping test counts

The supplied release record contains 1,542 backend cases, plus focused 42-case and 53-case runs. These runs overlap and represent different snapshots/scopes; older summaries also cite other backend counts. This report uses

the fresh complete-suite JUnit result as its primary backend count, and keeps inherited results separate. [E01; H01; C10]

> **Sampling and assumptions** — The explainer quality-floor module was skipped because its cases fixture is absent; model loadability was checked separately. Positive tests and limited hostile-input corpora do not establish exhaustive safety. The test harness is team-authored; representative user studies, independent attack testing and verification of the actual public deployment remain open.

4.2 Findings and remediation recorded by the team

Findings, fixes & open risks

Finding	Observed / documented issue	Recorded remediation and limits
F01 — account enumeration	Real and unknown accounts previously diverged after repeated failures.	Team records uniform failure tracking/lockout; S02 now includes same-answer and timing checks. Residual: intentional lockout can deny access temporarily. [S02; S08]
F02 — server banner	The server disclosed its implementation through its banner.	Team records --no-server-header in its container entrypoint and a regression check. Not a verification of this setting on the public host. [S08]
F03 — outbound telemetry	The older Docker capture observed ONNX Runtime DNS/HTTPS traffic to Microsoft telemetry infrastructure.	Recorded fix disables telemetry before import/API use and in the image. Repeated capture during demo plus idle found no public egress; no claim of perpetual network isolation. [S07; S08]
F04 — MFA dialog accessibility	A form carried inappropriate dialog semantics.	Team records a fix. This is an accessibility finding, not a security compromise. [S08]
F05 — plaintext document text	A synthetic passport embedded in an uploaded document was readable from the database in the earlier leak test.	Team records AES-256-GCM for document text, bound to its row; S03 now passes those canary checks. Legacy plaintext rows remain readable by the app; migration/backup retention remain open. Names/filenames stay plaintext. [S03; S08]
F06 — development dependencies	The earlier advisory snapshot records nine high-severity advisories in dev-only tooling.	Not fixed in that record; major upgrade deferred (R50). Historical production zero-advisory checks are not a current clean bill of health. [S08]
F07 — MITM probe precondition	An initial rerun produced five failures because bank-review gating returned 409 before the MFA step the probe intended to test.	Team records correcting the probe setup to clear the review with a reviewer's bound MFA proof, then retesting M1–M14. It was not evidence that approval bypass succeeded. The supplied final S04 log alone is not the initial-failure log. [S04; S08]

No runtime changes are made by this report update. Fix descriptions are inherited from the supplied security-testing record and capture, not newly implemented or independently retested here. Regression references include test_security_leaks.py, test_documents_at_rest.py, test_security_thief.py, test_ai_hostile_prompts.py, household-isolation tests and authentication lockout tests. The original source archive contains these unchanged files. [S08]

5. Summary of Recommendations

5.1 Release gates & incident readiness

Before any public or real-data use

Gate	Acceptance evidence required	Status in this review
G1 — Secret custody	Owner revocation record; independent key storage; recoverable encrypted backups.	Not established
G2 — Identity and access	Named accounts, real MFA enrollment/recovery; scoped reviewer access; admin audit.	Sandbox controls only
G3 — HTTPS and ingress	Actual origin/cookie/CSRF checks; trusted proxy policy; backend port isolation.	Not tested remotely
G4 — Persistence and continuity	Restore drill for DB + encryption/signing material; recovery objectives and incident owner.	Not tested
G5 — Integrity supervision	Independently retained checkpoint + alert on missing interval and failed verification.	Manual design only
G6 — Supply chain	Deployed-image dependency scan, SBOM, signed artifacts; approved model manifests.	No fresh advisory audit
G7 — Real-world integration	Licensed partners, reconciled settlement, KYC/sanctions, legal/privacy assessment.	Out of scope
G8 — Independent assurance	Threat-led assessment, retest of findings and deployment security review.	Not performed

Minimum incident procedure

- Restrict affected access and preserve logs/checkpoints before modifying records; do not destroy evidence by reseeding or resetting databases.
- Revoke sessions and affected provider credentials. Preserve the encryption key needed to recover existing ciphertext; plan re-encryption rather than blind key replacement.
- Check audit prefixes against an independently held checkpoint; reconcile simulated/real financial records using the correct integration boundary.
- Restore from a verified backup in an isolated environment; retest controls and record the operator’s release decision.

> **Disposition** — Proceed only as a controlled synthetic-data evaluation subject to operator approval. This report does not approve public production operation, real payment processing or legal compliance.

6. Introduction

6.1 Final-submission update

Verified after the original assessment

The original assessment in this document (18 October 2026) is unchanged: every result, count and risk below stands as written. This page adds read-only checks made later the same day, recorded in validation/final-verification.json (E07, produced by tools/final_verification.py), and supersedes the original statement that the remote repository was not checked. The final submission adds the attack-testing evidence and complete recorded case catalogue in section 7 and Appendix A; the original assessment boundary remains unchanged.

Item	Result
Source identity	The remote main branch of NoobCrow/StudyRoute is commit bcce930ae0974712e922245878fd976b03a8938a, the commit this document covers. The original assessment could not check the remote; this supersedes its statements that the remote HEAD was not checked. [E07]
Repository access	Public; default branch main. The README, the technical-documentation PDF and the deck load anonymously (HTTP 200). [E07]
Continuous integration	GitHub reports the workflow "ci" on that commit as success: docker, contracts, web, secret-scan, backend and dependency-audit all succeeded (run 39081290614). The job logs were not re-reviewed here. [E07]
Other branches	A branch named botkeep (3 commits, head e2c28a0c74b6) is on the remote and is not part of main. It was not assessed; this document still covers main only. [E07]
The one skipped test module	1,679 backend tests on a machine that has the explainer fixture (1,678 pass, 1 skipped); a fresh clone collects 1,673, runs 1,672 and skips one module whose fixture is excluded by .gitignore. 463 web tests (439 in an earlier pre-merge log) and 24 browser tests. The missing file is backend/tests/data/explainer_cases.json; adding it remains a maintainer action. Fixture-complete counts are supplied, not rerun by this report update.
Regulatory assumptions (SR-04)	Four study-abroad rules (one AD bank branch for the whole course, one academic year at a time, release per the institution's estimate, international cards for education) were read in the official Bangladesh Bank circular FEPD-1 No. 40 of 30 September 2026, section 10, and are marked verified in config/rules.yaml. The USD 2,000 a month living-cost figure is not in that text and stays unverified. This is the team's reading and no lawyer or AD bank has reviewed it, so SR-04 otherwise stands.
The team's Docker run (inherited, not re-run here)	Same day, in an Ubuntu 24.04 VM with Docker 29.1.3: the smoke checks, the 14-step demo (66 checks OK), the bank-review demo, a real-Chrome audit (48 of 48) and the hardened overlay (read-only filesystem, all capabilities dropped) passed. The run used the archive of commit 8d91cc8 with the two files of the later fix c9d044b copied in; it was not a fresh archive of bcce930. It first found that the trained explainer reworded the assistant's questions (3 demo checks failed; the CI docker job had failed 4); the fix is part of bcce930. Raw output: inherited/submission/evidence/docker_2026-10-18/ and docker_run.txt (H04).
Corrections to the original assessment	The current submission reconciles the counts in the preceding row. Section 4.1 keeps inherited run scopes separate; no historical raw test output has been rewritten. The new section 7 and Appendix A itemize the previously summarized team-run security probes.

Not changed by this update — The permission tiers, the control review, the risk register SR-01 to SR-10, the release gates G1 to G8, every count and result in section 4.1, and the conclusion that the evidence supports a controlled synthetic-data demonstration only.

7. Assessment Methodology

7.1 Attack testing, leakage and MITM: scope & results

Team-run security evidence — not a new test run

Purpose. This addition makes the previously compressed security evidence explicit. The six raw files from 18 October 2026 were inspected and their check labels counted for this report; the tools themselves were not re-executed. The team ran them against synthetic-data lab instances using throwaway databases, not against a third-party target or the current public Botkeep deployment. [S01–S06; S08]

Probe family	Recorded outcome	Raw evidence / tool
Attack surface / access control	146 PASS	S01; attack_probe.py
Login / MFA brute force	8 PASS	S02; brute_probe.py
Data-leakage canary scan	50 PASS + 2 INFO	S03; leak_scan.py

Probe family	Recorded outcome	Raw evidence / tool
MITM / approval / webhook replay	14 PASS + 4 INFO	S04; mitm_probe.py
Adversarial assistant prompts	42 PASS	S05; assistant_probe.py
Browser / CSP / stored XSS	48 PASS	S06; browser_audit.mjs

How to read PASS. It means the recorded check met its expected outcome; some checks are positive controls, not blocked attacks. The attack log also records 343 captured responses and a grouped anonymous-access check across 87 routes. A grouped check is not 87 additional independent tests. The catalogue contains all 308 PASS records and all 6 INFO records; these are not an aggregate count of unique attacks and must not be added to backend/web/browser suite totals. [S01–S06]

Evidence class. All probe outcomes below are inherited/team-authored evidence. This editorial pass checked case-label counts and file consistency only. It did not reproduce the network lab, establish exhaustive coverage or provide independent certification. Appendix A reproduces every PASS/INFO label, including the failures that the controls do not prevent. [S01–S06]

7.2 Attack families and expected safeguards

Attack surface & authorization

Area	Recorded case coverage	Evidence
Anonymous route access	Requests without tokens across the API routes; refusal and absence of server errors.	S01
Token forgery	Unsigned / wrong-algorithm / attacker-key / truncated / altered / expired tokens; refresh-as-access, garbage bearer and URL token cases.	S01
Cross-household reads	Other household payments, quotes, trackers, reports, instructions, escrows, bank records, recipients, documents, lists and audit data must not be returned.	S01
Cross-household mutation	Rename, cancel, approve/request, abandon, confirm and delete attempts, including borrowed proofs and idempotency keys, must not change another household.	S01
Privilege escalation	Parent/student calls to reviewer, configuration, KYC, chain, escrow, sandbox and audit actions; AI service-account sign-in.	S01
Bank review desk	24 new checks include reviewer-only queue access, household isolation, answer/reminder restrictions, proof binding, rejected extra fields and positive controls.	S01; S08
SQL / markup / template injection	Hostile strings in text/query/JSON inputs; no database disclosure or server failure. Browser execution is checked separately.	S01; S06; S08
Malformed input / mass assignment	Oversized and deeply nested bodies, invalid encodings/JSON, NUL, traversal, long identifiers and owner/role/status fields.	S01; S08
CORS / CSRF / browser sessions	Foreign/null/missing/cross-site origins and missing browser header, cookie-only authority, token without cookie, made-up cookie, logout/replay.	S01; S08
Protocol / headers / webhooks	TRACE, hostile request IDs, untrusted origins, signatures and no-store/security headers; webhook tamper/replay details in S04.	S01; S04
Login / MFA guessing	Account lockout, response/timing enumeration, rate limits, Retry-After, forwarded-IP spoofing and write floods.	S02
Adversarial assistant	20 hostile prompts as parent and student plus a post-prompt state check for each role: 42 recorded checks. Prompts seek secrets, instructions or forbidden financial actions.	S05
Browser injection / privacy	Stored and hostile-URL markup, reviewer note/reply, CSP, framing, cookie access, storage, asset/source-map secrets and third-party requests.	S06

The catalogue preserves the raw labels; labels such as “2.x” and “4.x” repeat in the original file. Report-local IDs AP-001, BF-001 and so on disambiguate them without inventing new test results. [S01–S06]

8. Detailed Findings

8.1 Permission tiers & separation of duties

Authorization

Effective authorization requires the intersection of role permissions, issued token scopes and object ownership, plus action-specific guards. UI hiding is not the authority boundary. The domain layer provides a separate explicit AI approval refusal. [C01; C03]

Capability	Parent	Student	Reviewer	AI
Create / read quotes	Yes	Yes	Read	Yes
Read payments	Own HH	Own HH	All	Delegated HH
Draft / request approval	Yes	No	No	Granted*
Approve payment	MFA	No	No	Never
Cancel payment	Yes	No	No	No
Reject payment	Yes	No	Yes	No
Create recipient	Yes	Yes	No	No
Allowlist recipient	MFA	No	No	No
Review KYC / bank decision	No	No	Yes**	No
Write configuration	No	No	Yes	No
Verify audit / anchor head	No	No	Yes	No
Bank transfer / escrow write	MFA	No	No	No
Escrow freeze / unfreeze	No	No	Yes	No
Submit review response	Yes	No	No	No

HH = household. *The AI service role contains draft/request permissions; the conversational tool path is narrower and proposes drafts rather than exposing all role capabilities. Do not describe the entire AI role as read-only.* *A bank review decision requires its own payment-bound MFA scope; a positive review does not itself approve or settle a payment. [C01; C07]

Full machine-derived permission matrix

The evidence bundle includes validation/rbac-matrix.json, generated directly from ROLE_PERMISSIONS. This compact report highlights decision-critical permissions rather than reproducing a potentially stale hand-maintained matrix. Relevant checks include test_rbac.py, test_api_roles.py, test_api_ai_rbac.py, test_security_households.py and test_bank_review.py. [E01; E06]

8.2 Identity & transaction safeguards

Control review — part i

Control	Implementation / boundary	Evidence
Authentication	Argon2id password hashing; ES256 access tokens; issuer/audience/expiry checks; legacy refresh rotation with reuse-family revocation. Default access lifetime 900 seconds.	C02; E01: test_api_auth.py
Browser session	Opaque HttpOnly, SameSite=Strict cookie; Secure in production; absolute expiry; server-side hashed session; access JWT bound to active cookie session.	C02; E01: test_browser_session.py
CSRF boundary	Browser authentication endpoints require trusted exact Origin and X-StudyRoute-Browser header; cross-site browser authentication rejected.	C02; E01: test_browser_session.py
Step-up authorization	Fresh, single-use proof bound to user, object and action; nominal five-minute validity; fixed sandbox MFA is not production-strength verification.	C02/C03; E01: test_api_payment_guards.py
Approval consistency	Current approval summary hash and recipient context checked; changed inputs invalidate approval; state transitions restricted.	C03; E01: test_api_payment_guards.py
Duplicate prevention	Caller-scoped UUID idempotency keys; same-body replay returns prior result; different body conflicts; optimistic locking and concurrency regression.	C03; E01: test_api_idempotency.py
Provider callback	HMAC-SHA256 over timestamp and raw body; constant-time comparison; 300-second freshness; event de-duplication; provider/payment matching.	C04; E01: test_api_webhooks.py

Interpretation — A passing guard test demonstrates the tested branch and fixture, not every deployment configuration. Many regression fixtures use a fake clock, reduced password-hash cost and disabled background/network behavior; they are not latency or brute-force performance benchmarks. [E01; backend/tests/helpers.py]

8.3 Data, AI & artifact protection

Control review — part ii

Sensitive data at rest

FieldCipher uses AES-256-GCM, fresh 12-byte random nonces and context-bound authenticated data. Selected sensitive fields, document text and saved AI credentials use this helper; this is not whole-database encryption. Some display metadata stays plaintext, and legacy plaintext document rows remain readable. Possession of both the database and encryption key defeats confidentiality. [C05; E01: test_documents_at_rest.py, test_saved_ai_connection.py]

AI cannot be the payment authority

Message/document policy checks, restricted tools, deterministic calculations, fact/number validation and guarded local explanations form layered controls. The local reader and dialogue policy propose; the risk model routes to human review; only a human parent approves a payment. No model benchmark is substituted for the domain authorization checks. [C01; C07–C08]

Optional external AI

The fresh demonstration used local components with ASSISTANT_CLOUD_ENABLED=false. Optional user/provider connections create a separate egress boundary: masking lowers exposure but cannot prove that all sensitive context has been removed or control provider retention. Consent, provider terms, data minimization and outbound restrictions require operator review. Live provider calls were not tested. [C05; C07; E06]

Model supply chain

Model and policy manifests use SHA-256 checks. These establish consistency with a trusted manifest, not publisher authenticity: an attacker able to replace both artifacts and manifests can substitute them. ONNX avoids pickle-style object deserialization but still relies on native parsers/runtime code; it is not a guarantee that arbitrary model files are safe. [C08; C10]

> **Deployment consideration — separate from this scope** — The planned GitHub Release download needs its own pinned-hash verification, trusted source configuration, resource limits and failure handling. It requires startup egress even when later inference is local. No such remote download was executed for this main-source assessment.

8.4 Audit integrity: the exact guarantee

Tamper evidence

 Trust-boundary diagram

Each audit event covers the preceding hash and canonical event fields. Application/database triggers restrict ordinary updates and deletes. Fresh verification returned PASS for 76 events; a deliberate edit to amount_minor at sequence 75 returned HASH_MISMATCH, and restoring the row returned PASS. Independent offline recomputation agreed with both the supplied 75-event chain and fresh 76-event chain. [C06; E03; E05]

Where the guarantee stops

- A local audit hash chain detects inconsistent alteration. It does not prove that the underlying economic event was truthful.
- The audit events and replayable simulated-chain log share SQLite. A privileged owner can rewrite and rehash both consistently.
- The existing coordinated-rewrite regression intentionally demonstrates that both local checks can pass. This is an acknowledged trust limitation, not a failed claim of external immutability.
- A separately retained trusted-prefix checkpoint can expose rewrite or truncation of the recorded prefix only if the attacker cannot replace that checkpoint. A different directory or read-only mode on the same administrator-controlled host does not establish independence.

> **No blockchain overclaim** — The sandbox uses an in-memory py-evm chain with persisted replay. No external validator set, public/consortium deployment or independently immutable timestamp service was verified. Production controls should use independently administered checkpoint retention and monitoring. [C06; H01]

8.5 Data-leakage scope and MITM exposure

Data leakage & transport

Data leakage: what the 50 checks actually scanned

S03 reports a 3,136,304-byte database, a 74,685-byte server log, 47 audit events and 13 captured responses. These figures describe that leak-scan run, not the separate fresh 76-event audit experiment. Checks search planted synthetic secrets across the relevant sinks: passwords (including an incorrect typed password), access/refresh tokens, browser cookie, MFA proof/code, full IBAN, chat email/phone/passport, document text, a passport inside a document, and password-hash/private-key/header-shaped leakage. [S03]

Recorded result: all 50 PASS checks were clear in their tested sinks. Two INFO records explicitly retain plaintext metadata: the recipient display name and uploaded document filename are stored in the database. This is not a claim that every database field is encrypted, that historical backups are clean, or that untested secrets cannot leak. [S03]

MITM: protected actions are not transport confidentiality

The 14 PASS records cover altered approval summary/hash, redirect to another payment, stripped/swapped MFA proof, stolen-token approval and allowlist attempts, a thief-controlled recipient, a valid approval control, approval replay/single-use proof, and changed/stale/cross-provider/replayed webhooks. The complete M1–M14 labels are in Appendix A. [S04]

Informational exposure	What the raw record says	Required boundary
Plain HTTP observation	One sign-in and nine authorized requests were readable to a passive listener. Passwords and bearer tokens were exposed in transit.	Use verified HTTPS/TLS; these tests do not establish the public site is correctly configured.
Captured-token reads	A captured bearer token could read the family's payments until its expiry (15 minutes in the probe).	Protect bearer/session secrets; revoke compromised sessions.
Captured-token cancellation	The thief could cancel a pending draft (no money moved). Approval and allowlist protections still held in the tested paths.	Review cancellation permissions/risk; transport secrecy remains necessary.

Four MITM INFO lines are retained in the catalogue, including the statement that TLS closes passive reading. Do not describe this result as "MITM-proof": transaction binding prevented tested unauthorized approvals, but plain HTTP confidentiality demonstrably failed. [S04]

9. Risk Methodology

9.1 Prioritized risk register

High-priority production gates

Priorities are qualitative judgments of what must be resolved before real-money or real-person deployment. They are not CVSS scores, independent vulnerability ratings or evidence that each scenario was exploited. Cross-references preserve continuity with the supplied R1–R55 register. Proposed owners have not formally accepted these actions. [C10]

SR-01 | Demo identity and environment misuse — High

Residual exposure: Public demo hints, shared sandbox credentials and fixed MFA are intentional demo shortcuts. **Required action:** Disable shared accounts/hints; provision named users and real enrollment/step-up; isolate evaluation access. **Proposed owner:** Security lead + operator. Original register: R1, R29.

SR-02 | Secret custody and earlier exposure — High

Residual exposure: Historical notes identify credentials in earlier workspace material. Clean source scans cannot revoke or prove deletion of prior copies. **Required action:** Owner revocation; separate key custody; rotation/migration plan; verify encrypted backup restoration. **Proposed owner:** Repository owner + operator. Original register: R13, R46, R49, R55.

SR-03 | Privileged audit rewrite — High

Residual exposure: Local database and simulated-chain logs share one administrative trust domain. **Required action:** Independently protected checkpoints; log export/retention and missing-checkpoint alerts; restricted database privileges. **Proposed owner:** Platform + security lead. Original register: R7, R8, R22, R23.

SR-04 | Unverified regulatory / financial assumptions — High

Residual exposure: Invented bank rails, quotes, sanctions and some thresholds are not production banking rules or legal advice. **Required action:** Keep synthetic labels; use authoritative validated rules and licensed/supervised

integrations before real use. **Proposed owner:** Product + regulated partner. Original register: R11, R12, R17, R19–R21, R26, R41, R43, R51.

SR-05 | Public deployment not validated — High

Residual exposure: TLS, reverse-proxy trust, cookie origin, data persistence, restore and operational controls were not verified on Botkeep. **Required action:** Review ingress; verify HTTPS and CSRF end to end; test restore; restrict demonstration access. **Proposed owner:** Deployment operator. Original register: R4, R5, R30, R31.

> **Risk disposition** — Controls in the sandbox lower ordinary application-level risk; they do not close these production gates. No risk acceptance signature or production go-live approval is implied.

9.2 Residual risk & remediation

Medium-priority actions

SR-06 | AI error and malicious instructions — Medium

Residual exposure: Heuristic filters and statistical models miss some attacks; guarded wording is not a proof of factual safety. **Required action:** Retain deterministic gates, human approval and model-free fallback; expand adversarial and representative evaluation. **Proposed owner:** AI + security lead. Original register: R9, R10, R18, R32, R34, R35, R39, R44, R53, R54.

SR-07 | Model / dependency substitution — Medium

Residual exposure: Hash checks depend on trusted manifests; native model runtimes and development tools remain supply-chain attack surfaces. **Required action:** Protected reviews; signed releases/manifests; fresh SBOM/advisory checks for deployed image; controlled egress. **Proposed owner:** Maintainer + release lead. Original register: R14, R27, R33, R36, R38, R40, R42, R50.

SR-08 | Privacy, retention and external providers — Medium

Residual exposure: Plain display metadata and legacy rows remain; external AI retention/behavior is outside local control. **Required action:** Data inventory/retention; migrate legacy rows; consent and vendor review; remove data from logs and artifacts. **Proposed owner:** Privacy + product lead. Original register: R15, R37, R45, R46, R48, R49, R55.

SR-09 | Scale, abuse and identity operations — Medium

Residual exposure: Rate limits are process-local; no external identity lifecycle or distributed abuse controls are established. **Required action:** Shared rate-limit store; account lifecycle and recovery; monitor abuse and session revocation. **Proposed owner:** Platform + identity lead. Original register: R2, R3, R6, R16, R28, R47.

SR-10 | Reviewer and privileged workflow abuse — Medium

Residual exposure: The demo reviewer has broad cross-household visibility; real mandates and dual control are not established. **Required action:** Named reviewers; least-privilege scoping; escalation and dual review for sensitive decisions. **Proposed owner:** Operations + security lead. Original register: R24, R25, R52.

Assessment corrections carried into this report

The inherited “AI can only quote” wording is distinguished from the broader AI service-role permission set. ONNX is not described as immune to runtime vulnerabilities. Prompt filtering is not described as guaranteeing harmless output. Historical zero-advisory checks are not presented as a current clean dependency bill of health. [C01; C08; C10; H01]

10. Documentation Lists

10.1 References & evidence locator

Traceability

Bracketed identifiers link claims to source paths or bundled raw evidence. The original repository source is the supplied archive; the final-submission update verified that the remote main branch is the same commit (E07). Fresh results are located under validation/ in the companion evidence bundle. The full catalogue and per-file hashes are in EVIDENCE_INDEX.md and SHA256SUMS.txt.

ID	Reference

Primary fresh references: E01 regression; E02 local API run; E03 audit/tamper; E04 financial/escrow; E05 provenance/recomputation; E06 source scan/model loading. Historical references H01–H04 remain explicitly inherited. See the companion Execution Evidence Report for their exact scope.

> **Source identity** — Archive SHA-256: 4e6ce74cdafa51e4fa577813444d1f52c7d1d0098a7338b176005b415574134a. Source identifier: bcce930ae0974712e922245878fd976b03a8938a. These identifiers bind the assessment to this archive—not to subsequent commits or a different deployment branch.

10.2 Evidence references and assessment limits

History, traceability & reproduction

Keep the dates and assurance levels separate

The supplied 17 October record lists 122 attack checks and 42 browser checks; the 18 October files expand those to 146 and 48. They are different snapshots, not additive achievements. The 17 October record also lists TLS 8/8 (old protocol refusal, TLS 1.2/1.3, HSTS, Secure cookie and HTTP-on-TLS-port), but there is no corresponding TLS raw

log in the supplied 18 October folder. Treat that TLS result as a source-document historical claim, not a new raw-log-verified 18 October run. It used application TLS, not a validation of nginx or the public Botkeep domain. [S08]

The older network-connection samples, Git-history scans, advisory checks and static rules are likewise historical snapshots; they do not prove current dependency safety, absence of every secret in every revision, or safe public ingress. S07 is a hand-recorded packet-capture transcript, not a new packet capture or the binary PCAP itself. [S07; S08]

ID	Evidence item	SHA-256
S01	attack_probe.txt — 18 October team-run log	76437f9cfd5bac4b48fad0c3762e7ebdf5770105758c124b5fd3f2c00e2849bc
S02	brute_probe.txt — 18 October team-run log	628c2d793667b7bd0bf86d080062b872c9f9e185ba62dd3e8e9affe3a0c2fdba
S03	leak_scan.txt — 18 October team-run log	2a48d6714362df99fc39c93429ea5ac9b1c05ff1b8b7bcbe17fe4d1cf329418b
S04	mitm_probe.txt — 18 October team-run log	be608732176a314cc3040b8cb6096490e28e261bbea08890db39a0d0df468d4b
S05	assistant_probe.txt — 18 October team-run log	733859305a460142934689bf1e64d609f61efdb829c1b4697739d3d5c8db0ec3
S06	browser_audit.txt — 18 October team-run log	a90d9bafb8c68107cdec625bbb8e115fe917cf1513af5508f0f0af17395c7ebb
S07	docker_telemetry_capture.txt — 15 October hand-recorded capture transcript	b90cc1c89382600d2d65296d91b07c89635ce68b48acf35e14ff8506c303cf0a
S08	SECURITY_TESTING_RECORD.md — unchanged copy of source docs/SECURITY_TESTING.md	015fd8d73e4a7e8eab47dc83a0794aaa24e0cb52cc8170dda4fca4ef53a64079

Evidence-pack paths: S01–S06 are under inherited/submission/evidence/security_2026-10-18/; S07 is inherited/submission/evidence/docker_telemetry_capture.txt; S08 is security_appendix/SECURITY_TESTING_RECORD.md. The machine-readable full catalogue is security_appendix/PROBE_CASE_CATALOGUE.csv. In the source archive, the original records are under submission/evidence/ and docs/SECURITY_TESTING.md. File hashes provide consistency, not proof of author identity.

Reproduction entry points: read scripts/security/README.md and use the supplied attack_probe.py, brute_probe.py, leak_scan.py, mitm_probe.py, assistant_probe.py and browser_audit.mjs only against a separately authorized disposable sandbox. No commands or targets were executed in this editorial update. A fresh deployed-HTTPS review, external pentest, real-provider testing and broader model-adversarial assessment remain open.

Appendix A. Complete Recorded Check Catalogue

Recorded security checks — attack surface

Every PASS and INFO line from S01–S06 is listed below in original order within its file. Case labels are copied verbatim; raw labels may already truncate payloads/URLs, and this report does not reconstruct omitted strings. “PASS” preserves the source status, including successful positive controls. An INFO row is an exposure or observation, not an attack that was necessarily blocked. No original raw file was edited.

S01 | attack_probe.txt | Records 1–18 of 146 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
AP-001 L1	1.1 all 87 routes refuse an anonymous caller	PASS

Case / line	Recorded check label	Status
AP-002 L2	1.2 no anonymous request causes a server error (500)	PASS
AP-003 L3	2.x forged token refused: alg=none	PASS
AP-004 L4	2.x forged token refused: HS256 signed with the public key (algorithm confusion)	PASS
AP-005 L5	2.x forged token refused: ES256 signed with an attacker's own key	PASS
AP-006 L6	2.x forged token refused: valid token with the signature cut off	PASS
AP-007 L7	2.x forged token refused: valid header and claims, flipped signature	PASS
AP-008 L8	2.x forged token refused: expired token	PASS
AP-009 L9	2.x forged token refused: refresh token used as an access token	PASS
AP-010 L10	2.x forged token refused: empty bearer	PASS
AP-011 L11	2.x forged token refused: random garbage	PASS
AP-012 L12	2.y a token in the URL query string is ignored	PASS
AP-013 L13	2.z a non-Bearer scheme is refused	PASS
AP-014 L14	3.1 parent2 cannot read household 1's payment	PASS
AP-015 L15	3.2 parent2 cannot read household 1's payment tracker	PASS
AP-016 L16	3.3 parent2 cannot read household 1's compliance report	PASS
AP-017 L17	3.4 parent2 cannot read household 1's instruction preview	PASS
AP-018 L18	3.5 parent2 cannot read household 1's quote	PASS

Attack surface / authorization — continued

S01 | attack_probe.txt | Records 19–36 of 146 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
AP-019 L19	3.6 parent2 cannot read household 1's escrow	PASS
AP-020 L20	3.7 parent2 cannot see household 1's bank transfer	PASS
AP-021 L21	3.8 parent2 cannot see household 1's statement	PASS
AP-022 L22	3.1 student2 cannot read household 1's payment	PASS
AP-023 L23	3.2 student2 cannot read household 1's payment tracker	PASS
AP-024 L24	3.3 student2 cannot read household 1's compliance report	PASS
AP-025 L25	3.4 student2 cannot read household 1's instruction preview	PASS
AP-026 L26	3.5 student2 cannot read household 1's quote	PASS
AP-027 L27	3.6 student2 cannot read household 1's escrow	PASS
AP-028 L28	3.7 student2 cannot see household 1's bank transfer	PASS
AP-029 L29	3.8 student2 cannot see household 1's statement	PASS
AP-030 L30	3.9 parent2 cannot rename household 1's recipient	PASS
AP-031 L31	3.10 parent2 cannot cancel household 1's payment	PASS
AP-032 L32	3.11 parent2 cannot request approval of household 1's payment	PASS

Case / line	Recorded check label	Status
AP-033 L33	3.12 parent2 cannot confirm household 1's escrow even with a proof for it	PASS
AP-034 L34	3.13 parent2 cannot abandon household 1's escrow	PASS
AP-035 L35	3.14 parent2 cannot cancel household 1's escrow	PASS
AP-036 L36	3.15 parent2 cannot delete household 1's document	PASS

Attack surface / authorization — continued

S01 | attack_probe.txt | Records 37–54 of 146 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
AP-037 L37	3.16 parent2 cannot confirm household 1's bank transfer	PASS
AP-038 L38	3.17 a stolen MFA proof does not work for another user	PASS
AP-039 L39	3.18 cannot even mint a proof for someone else's escrow	PASS
AP-040 L40	3.19 household 2's lists contain nothing of household 1	PASS
AP-041 L41	3.20 household 2's audit view has none of household 1's events	PASS
AP-042 L42	3.21 student cannot approve	PASS
AP-043 L43	3.22 student cannot lock escrow funds	PASS
AP-044 L44	3.23 student cannot allowlist a recipient	PASS
AP-045 L45	3.24 student cannot reset the household's data	PASS
AP-046 L46	3.25 student cannot confirm a bank transfer	PASS
AP-047 L47	4.x parent refused: PUT config	PASS
AP-048 L48	4.x parent refused: PUT kyc	PASS
AP-049 L49	4.x parent refused: POST chain	PASS
AP-050 L50	4.x parent refused: GET chain	PASS
AP-051 L51	4.x parent refused: POST chain/..	PASS
AP-052 L52	4.x parent refused: POST escrows/..	PASS
AP-053 L53	4.x parent refused: POST escrows/..	PASS
AP-054 L54	4.x parent refused: POST sandbox/..	PASS

Attack surface / authorization — continued

S01 | attack_probe.txt | Records 55–72 of 146 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
AP-055 L55	4.x parent refused: GET audit	PASS
AP-056 L56	4.x student refused: PUT config	PASS
AP-057 L57	4.x student refused: PUT kyc	PASS
AP-058 L58	4.x student refused: POST chain	PASS

Case / line	Recorded check label	Status
AP-059 L59	4.x student refused: GET chain	PASS
AP-060 L60	4.x student refused: POST chain/..	PASS
AP-061 L61	4.x student refused: POST escrows/..	PASS
AP-062 L62	4.x student refused: POST escrows/..	PASS
AP-063 L63	4.x student refused: POST sandbox/..	PASS
AP-064 L64	4.x student refused: GET audit	PASS
AP-065 L65	4.y the AI service account cannot sign in	PASS
AP-066 L66	4b.0 control: the flagged payment is waiting for the bank's reviewer	PASS
AP-067 L67	4b.1 parent cannot open the reviewer's queue	PASS
AP-068 L68	4b.1 student cannot open the reviewer's queue	PASS
AP-069 L69	4b.1 parent2 cannot open the reviewer's queue	PASS
AP-070 L70	4b.2 control: the reviewer's queue lists the waiting payment	PASS
AP-071 L71	4b.3 parent2 cannot read household 1's review page	PASS
AP-072 L72	4b.3 student2 cannot read household 1's review page	PASS

Attack surface / authorization — continued

S01 | attack_probe.txt | Records 73–90 of 146 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
AP-073 L73	4b.4 parent2 cannot answer the bank's question for household 1	PASS
AP-074 L74	4b.5 parent2 cannot send a reminder for household 1	PASS
AP-075 L75	4b.6 a student cannot answer the bank's question	PASS
AP-076 L76	4b.7 parent cannot clear a review, even holding an MFA proof of their own	PASS
AP-077 L77	4b.7 student cannot clear a review, even holding an MFA proof of their own	PASS
AP-078 L78	4b.7 parent2 cannot clear a review, even holding an MFA proof of their own	PASS
AP-079 L79	4b.8 the reviewer's yes without an MFA proof is refused	PASS
AP-080 L80	4b.9 a proof minted for a different payment is refused	PASS
AP-081 L81	4b.10 a proof minted for another action (scope) is refused	PASS
AP-082 L82	4b.11 the decision needs an Idempotency-Key	PASS
AP-083 L83	4b.12 an unknown decision value is refused	PASS
AP-084 L84	4b.13 mass assignment on the decision is refused	PASS
AP-085 L85	4b.14 the parent cannot approve while the bank's review is open (even with a fresh proof)	PASS
AP-086 L86	4b.15 none of the refused attempts changed the review	PASS
AP-087 L87	4b.16 control: the reviewer with a fresh proof can clear it	PASS
AP-088 L88	4b.17 the same proof cannot be used a second time	PASS
AP-089 L89	4b.18 the replay did not change the answer (still CLEARED)	PASS

Case / line	Recorded check label	Status
AP-090 L90	5.1 SQL-injection strings cause no server error	PASS

Attack surface / authorization — continued

S01 | attack_probe.txt | Records 91–108 of 146 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
AP-091 L91	5.2 no database error, path or stack trace appears in any response	PASS
AP-092 L92	5.3 after the barrage logins and recipients still work (nothing was dropped)	PASS
AP-093 L93	5.4 script text in a name is stored as inert data, served as JSON with nosniff	PASS
AP-094 L94	5.5 an escrow reference with markup is refused	PASS
AP-095 L95	5.6 a freeze reason is length-limited	PASS
AP-096 L96	5.7 a 3 MB body is refused (413) before it is parsed	PASS
AP-097 L97	5.8 200,000-deep JSON nesting does not crash the server	PASS
AP-098 L98	5.9 invalid UTF-8 is a clean 4xx	PASS
AP-099 L99	5.10 NUL bytes do not break storage	PASS
AP-100 L100	5.11 malformed JSON is a clean 4xx	PASS
AP-101 L101	5.12 mass assignment (extra owner_id, allowlisted, role) is refused	PASS
AP-102 L102	5.13 mass assignment on escrows is refused	PASS
AP-103 L103	5.14 path traversal and absurdly long ids give clean 4xx	PASS
AP-104 L104	6.1 TRACE is not allowed	PASS
AP-105 L105	6.2 a CORS preflight from an evil origin is not approved	PASS
AP-106 L106	6.3 a normal request from an evil origin gets no allow-origin header	PASS
AP-107 L107	6.4 credentials are never allowed cross-origin	PASS
AP-108 L108	6.5 a webhook with no signature is refused	PASS

Attack surface / authorization — continued

S01 | attack_probe.txt | Records 109–126 of 146 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
AP-109 L109	6.6 a webhook with a forged signature is refused	PASS
AP-110 L110	6.7 a hostile X-Request-ID is replaced, never reflected	PASS
AP-111 L111	6.8 reusing someone else's Idempotency-Key does not replay their response	PASS
AP-112 L112	6.9 the same user reusing a key with a different body is refused	PASS
AP-113 L113	6.10 browser sign-in with no Origin is refused and sets no cookie	PASS
AP-114 L114	6.10 browser sign-in from a foreign Origin is refused and sets no cookie	PASS
AP-115 L115	6.10 browser sign-in from the null Origin is refused and sets no cookie	PASS

Case / line	Recorded check label	Status
AP-116 L116	6.10 browser sign-in without the browser header is refused and sets no cookie	PASS
AP-117 L117	6.10 browser sign-in marked cross-site by the browser is refused and sets no cookie	PASS
AP-118 L118	6.11 a wrong password through the browser route gets 401 and no cookie	PASS
AP-119 L119	6.12 the session cookie is HttpOnly, SameSite=Strict and limited to the API path	PASS
AP-120 L120	6.13 the sign-in body holds an access token but never a refresh token or the cookie value	PASS
AP-121 L121	6.14 a stolen cookie sent from a foreign Origin restores nothing	PASS
AP-122 L122	6.15 the cookie alone is never API authority (no ambient credential, so no CSRF)	PASS
AP-123 L123	6.16 a made-up cookie value restores nothing	PASS
AP-124 L124	6.17 the real cookie from the real Origin restores the session	PASS
AP-125 L125	6.18 an access token lifted from the page is useless without its cookie (bound to the session)	PASS
AP-126 L126	6.18b the access token works together with its own cookie	PASS

Attack surface / authorization — continued

S01 | attack_probe.txt | Records 127–144 of 146 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
AP-127 L127	6.19 logout succeeds and clears the cookie	PASS
AP-128 L128	6.20 after logout the old cookie restores nothing	PASS
AP-129 L129	6.21 after logout the token and cookie of that session are refused together	PASS
AP-130 L130	7.1 no response ever contains a password hash	PASS
AP-131 L131	7.1 no response ever contains an MFA secret field	PASS
AP-132 L132	7.1 no response ever contains the encrypted-account field	PASS
AP-133 L133	7.1 no response ever contains a private key	PASS
AP-134 L134	7.1 no response ever contains a full IBAN of a recipient	PASS
AP-135 L135	7.1 no response ever contains the refresh-token family or token hash	PASS
AP-136 L136	7.1 no response ever contains a database file path	PASS
AP-137 L137	7.3 no endpoint sets a cookie except the browser sign-in routes (nothing else to track a browser with)	PASS
AP-138 L138	7.4 the Server header discloses no version	PASS
AP-139 L139	7.5 every response carries x-content-type-options	PASS
AP-140 L140	7.5 every response carries x-frame-options	PASS
AP-141 L141	7.5 every response carries referrer-policy	PASS
AP-142 L142	7.5 every response carries content-security-policy	PASS
AP-143 L143	7.5 every response carries permissions-policy	PASS
AP-144 L144	7.5 every response carries strict-transport-security	PASS

Attack surface / authorization — continued

S01 | attack_probe.txt | Records 145–146 of 146 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
AP-145 L145	7.5 every response carries cache-control	PASS
AP-146 L146	7.6 API responses are no-store (never cached by a browser or proxy)	PASS

Brute force / account enumeration

S02 | brute_probe.txt | Records 1–8 of 8 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
BF-001 L1	1 unknown user and wrong password return the same status and message	PASS
BF-002 L2	2 response time does not reveal whether an account exists	PASS
BF-003 L3	3 a burst of logins gets 429, and forging X-Forwarded-For does not bypass it	PASS
BF-004 L4	3b the 429 carries Retry-After and a problem body	PASS
BF-005 L5	4 after repeated wrong passwords even the right password is refused (account locked)	PASS
BF-006 L6	4b a locked REAL account and a made-up address give the identical answer (no way to discover accounts)	PASS
BF-007 L7	5 repeated wrong MFA codes lock MFA, so the right code is then refused	PASS
BF-008 L8	6 a flood of quote requests is throttled (429)	PASS

Data leakage / planted canaries

S03 | leak_scan.txt | Records 1–18 of 52 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
DL-001 L3	the real password is not in the database	PASS
DL-002 L4	the real password is not in the server log	PASS
DL-003 L5	the real password is not in the audit log	PASS
DL-004 L6	a wrong password someone typed is not in the database	PASS
DL-005 L7	a wrong password someone typed is not in the server log	PASS
DL-006 L8	a wrong password someone typed is not in the audit log	PASS
DL-007 L9	a wrong password someone typed is not in the responses	PASS
DL-008 L10	the access token is not in the database	PASS
DL-009 L11	the access token is not in the server log	PASS
DL-010 L12	the access token is not in the audit log	PASS
DL-011 L13	the refresh token is not in the database	PASS
DL-012 L14	the refresh token is not in the server log	PASS
DL-013 L15	the refresh token is not in the audit log	PASS

Case / line	Recorded check label	Status
DL-014 L16	the browser session cookie is not in the database	PASS
DL-015 L17	the browser session cookie is not in the server log	PASS
DL-016 L18	the browser session cookie is not in the audit log	PASS
DL-017 L19	a one-time MFA proof is not in the database	PASS
DL-018 L20	a one-time MFA proof is not in the server log	PASS

Data leakage / planted canaries — continued

S03 | leak_scan.txt | Records 19–36 of 52 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
DL-019 L21	a one-time MFA proof is not in the audit log	PASS
DL-020 L22	the MFA code is not in the database	PASS
DL-021 L23	the MFA code is not in the server log	PASS
DL-022 L24	the MFA code is not in the audit log	PASS
DL-023 L25	a full IBAN is not in the database	PASS
DL-024 L26	a full IBAN is not in the server log	PASS
DL-025 L27	a full IBAN is not in the audit log	PASS
DL-026 L28	a full IBAN is not in the responses	PASS
DL-027 L29	an e-mail typed into the chat is not in the database	PASS
DL-028 L30	an e-mail typed into the chat is not in the server log	PASS
DL-029 L31	an e-mail typed into the chat is not in the audit log	PASS
DL-030 L32	a phone number typed into the chat is not in the database	PASS
DL-031 L33	a phone number typed into the chat is not in the server log	PASS
DL-032 L34	a phone number typed into the chat is not in the audit log	PASS
DL-033 L35	a passport number typed into the chat is not in the database	PASS
DL-034 L36	a passport number typed into the chat is not in the server log	PASS
DL-035 L37	a passport number typed into the chat is not in the audit log	PASS
DL-036 L38	a recipient's display name is not in the server log	PASS

Data leakage / planted canaries — continued

S03 | leak_scan.txt | Records 37–52 of 52 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
DL-037 L39	a recipient's display name is not in the audit log	PASS
DL-038 L40	a recipient's display name is stored in plain text in the database	INFO
DL-039 L41	an uploaded document's text is not in the database	PASS

Case / line	Recorded check label	Status
DL-040 L42	an uploaded document's text is not in the server log	PASS
DL-041 L43	an uploaded document's text is not in the audit log	PASS
DL-042 L44	an uploaded document's file name is not in the server log	PASS
DL-043 L45	an uploaded document's file name is not in the audit log	PASS
DL-044 L46	an uploaded document's file name is stored in plain text in the database	INFO
DL-045 L47	a passport number inside an uploaded document is not in the database	PASS
DL-046 L48	a passport number inside an uploaded document is not in the server log	PASS
DL-047 L49	a passport number inside an uploaded document is not in the audit log	PASS
DL-048 L50	the server log holds no a JWT-shaped token	PASS
DL-049 L51	the server log holds no an Authorization header value	PASS
DL-050 L52	the server log holds no a private key	PASS
DL-051 L53	the server log holds no a password hash	PASS
DL-052 L54	the server log holds no a cookie value	PASS

Man-in-the-middle / replay

S04 | mitm_probe.txt | Records 1–18 of 18 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
MM-001 L1	a passive listener on plain HTTP reads the sign-in password and every bearer token -> 1 login(s) and 9 authorised request(s) were readable	INFO
MM-002 L2	TLS is what closes this (risk R4); the checks below show what still holds WITHOUT it	INFO
MM-003 L3	M1 a changed approval hash (what the person saw is not what is approved) is refused	PASS
MM-004 L4	M2 an approval redirected to another payment (proof and hash were for the first) is refused	PASS
MM-005 L5	M3 an approval whose MFA proof was stripped in transit is refused	PASS
MM-006 L6	M4 an approval with another action's MFA proof swapped in is refused	PASS
MM-007 L7	M5 a stolen bearer token cannot approve a payment without an MFA proof	PASS
MM-008 L8	M6 a stolen bearer token cannot de-list or allowlist a recipient without an MFA proof	PASS
MM-009 L9	M7 a payment to the thief's own recipient cannot even be put up for approval (not allowlisted)	PASS
MM-010 L10	a thief holding a captured token can READ the family's payments until the token expires (15 minutes) -> GET /payments -> 200; this is why TLS matters	INFO

Case / line	Recorded check label	Status
MM-011 L11	a thief holding a captured token can cancel a pending draft (no money moves) -> POST cancel -> 200	INFO
MM-012 L12	M8 the genuine approval (control) succeeds	PASS
MM-013 L13	M9 replaying the recorded approval exactly (same key, same proof) makes no second approval	PASS
MM-014 L14	M10 replaying it with a new Idempotency-Key is refused (the MFA proof is single-use)	PASS
MM-015 L15	M11 a webhook whose body was changed after signing is refused	PASS
MM-016 L16	M12 a correctly signed but old webhook (replayed an hour later) is refused	PASS
MM-017 L17	M13 a webhook signed by a different provider cannot change this provider's payment	PASS
MM-018 L18	M14 replaying a genuine webhook (same event id) has no second effect	PASS

Adversarial assistant prompts

BR-013 L13	parent: /sandbox ran no injected script	PASS
BR-014 L14	parent: the bank review page ran no injected script	PASS
BR-015 L15	parent: the review page shows the planted markup as literal text	PASS
BR-016 L16	the planted markup is shown as literal text, not interpreted	PASS
BR-017 L17	admin: / ran no injected script	PASS
BR-018 L18	admin: /payments ran no injected script	PASS

Browser / CSP / XSS / tracking — continued

S06 | browser_audit.txt | Records 19–36 of 48 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
BR-019 L19	admin: /audit ran no injected script	PASS
BR-020 L20	admin: /rules ran no injected script	PASS
BR-021 L21	admin: /bank ran no injected script	PASS
BR-022 L22	admin: /escrow ran no injected script	PASS
BR-023 L23	admin: /sandbox ran no injected script	PASS

Case / line	Recorded check label	Status
BR-024 L24	admin: /bank-review ran no injected script	PASS
BR-025 L25	admin: the bank review page ran no injected script	PASS
BR-026 L26	admin: the review page shows the planted markup as literal text	PASS
BR-027 L27	hostile URL /payments/%3Cimg%20src=x%20onerr... ran nothing	PASS
BR-028 L28	hostile URL /?q=%3Cscript%3Ewindow.__xss=7%3... ran nothing	PASS
BR-029 L29	hostile URL /escrow#%3Csvg%20onload=window._... ran nothing	PASS
BR-030 L30	the document carries the production CSP	PASS
BR-031 L31	the CSP forbids inline scripts, remote scripts, frames and plugins	PASS
BR-032 L32	CSP blocks an inline script injected into the page	PASS
BR-033 L33	CSP blocks an injected inline style attribute	PASS
BR-034 L34	CSP blocks a script from another origin	PASS
BR-035 L35	CSP blocks the page from sending data to another origin (connect-src)	PASS
BR-036 L36	the app refuses to be framed (clickjacking)	PASS

Browser / CSP / XSS / tracking — continued

S06 | browser_audit.txt | Records 37–48 of 48 in this file. Case IDs are local to this report; line numbers refer to the original raw log.

Case / line	Recorded check label	Status
BR-037 L37	no CSP violation came from the app's own pages (only from my attack attempts)	PASS
BR-038 L38	every request the app made went to its own origin (no third parties, no analytics, no CDN, no fonts)	PASS
BR-039 L39	the app made 1677 requests, none to a tracker	PASS
BR-040 L40	no request carried a Referer header (Referrer-Policy: no-referrer)	PASS
BR-041 L41	the only cookie is the one HttpOnly, SameSite=Strict session cookie (nothing to track a browser with)	PASS
BR-042 L42	script cannot read the session cookie (document.cookie is empty)	PASS
BR-043 L43	localStorage holds nothing sensitive (only a theme choice and rate-alert targets)	PASS
BR-044 L44	sessionStorage holds no token, password or e-mail (the refresh token is no longer in JavaScript storage)	PASS
BR-045 L45	no analytics globals (ga, gtag, dataLayer, fbq) exist	PASS
BR-046 L46	signing out removes the session cookie and leaves nothing in sessionStorage	PASS
BR-047 L47	none of 42 downloaded assets reference a source map	PASS
BR-048 L48	none of the downloaded JavaScript or CSS contains a key, token or password	PASS

Catalogue acceptance boundary. This is a complete transcription of the supplied PASS/INFO labels for the six listed files, not proof of complete attack coverage. Absence of FAIL lines in these final logs does not mean no issue was ever found; section 4.2 records the documented findings and the MITM probe-precondition correction. No overall vulnerability-free or production-safe conclusion is asserted.
